About ITExamsQuiz

At ITExamsQuiz, we believe every IT professional deserves access to high-quality exam preparation without breaking the bank. Our expert team curates accurate, up-to-date study material for a wide range of certification exams.

With ITExamsQuiz you get expert-vetted study material, real exam insights, and a fair shot at success.

- ✓ **Lifetime Free Updates**
- ✓ **Money-Back Guarantee**
- ✓ **100% Verified Questions**
- ✓ **24/7 Support via Email**

Doubt Support

We resolve 400+ doubts every day with an average rating of 4.8/5.

★ ★ ★ ★ ★ **Logan**

I passed with 920/1000! More than 45 questions were from your PDFs. Highly recommended!

★ ★ ★ ★ ★ **Hailey**

Updated material and correct answers. Passed AZ-900 on first attempt. Thank you ITExamsQuiz!

★ ★ ★ ★ ★ **Brandon**

Amazing accuracy. Out of 52 questions, 50 were from your dumps. Passed with 870 marks!

★ ★ ★ ★ ★ **Madison**

Customer support is very responsive. The PDFs are super accurate. Will recommend to friends!

Question: 1

ITExamsQuiz

You need to augment your organization's existing Security Command Center (SCC) implementation with additional detectors. You have a list of known IoCs and would like to include external signals for this capability to ensure broad detection coverage. What should you do?

- A. Create a custom posture for your organization that combines the prebuilt Event Threat Detection and Security Health Analytics (SHA) detectors.
- B. Create a Security Health Analytics (SHA) custom module using the compute address resource.
- C. Create an Event Threat Detection custom module using the "Configurable Bad IP" template.
- D. Create a custom log sink with internal and external IP addresses from threat intelligence. Use the SCC API to generate a finding for each even

✓ **Answer: C**

Explanation:

Comprehensive and Detailed 150 to 250 words of Explanation From Exact Extract Google Security Operations Engineer documents:

The correct solution is to create an Event Threat Detection (ETD) custom module. ETD is the Security

Command Center (SCC) service designed to analyze logs for active threats, anomalies, and malicious behavior. The user's requirement is to use a list of known Indicators of Compromise (IoCs) and external signals, which directly aligns with the purpose of ETD.

In contrast, Security Health Analytics (SHA), mentioned in options A and B, is a posture management service. SHA custom modules are used to detect misconfigurations and vulnerabilities in resource settings, not to analyze log streams for threat activity based on IoCs.

Event Threat Detection provides pre-built templates for creating custom modules to simplify the detection engineering process. The "Configurable Bad IP" template is specifically designed for this exact use case. It allows an organization to upload and maintain a list of known malicious IP addresses (a common form of external IoC). ETD will then continuously scan relevant log sources, such as VPC Flow Logs, Cloud DNS logs, and Cloud NAT logs. If any activity to or from an IP address on this custom list is detected, ETD automatically generates a CONFIGURABLE_BAD_IP finding in Security Command Center for review and response. This approach is the native, efficient, and supported method for integrating IP-based IoCs into SCC, unlike option D which requires building a complex, manual pipeline.

Question: 2

ITExamsQuiz

You have identified a common malware variant on a potentially infected computer. You need to find reliable IoCs and malware behaviors as quickly as possible to confirm whether the computer is infected and search for signs of infection on other computers. What should you do?

- A. Search for the malware hash in Google Threat Intelligence, and review the results.
- B. Run a Google Web Search for the malware hash, and review the results.
- C. Create a Compute Engine VM, and perform dynamic and static malware analysis.
- D. Perform a UDM search for the file checksum in Google Security Operations (SecOps). Review activities that are associated with, or attributed to, the malware.

✓ Answer: A

Explanation:

Comprehensive and Detailed 150 to 250 words of Explanation From Exact Extract Google Security Operations Engineer documents:

The correct answer is A. The most effective and reliable method for a security engineer to "find reliable IoCs and malware behaviors" is to use Google Threat Intelligence (GTI). When a known indicator like a file hash is identified, the primary workflow is threat enrichment. Google Threat Intelligence, which is a core component of the Google SecOps platform and incorporates intelligence from Mandiant and VirusTotal, is the dedicated tool for this. Searching the hash in GTI provides a comprehensive report on the malware variant, including all associated reliable IoCs (e.g., C2 domains, IP addresses, related file hashes) and malware behaviors (TTPs, attribution, and context). This directly fulfills the user's need.

In contrast, Option D (UDM search) is the subsequent step. A UDM search is used to hunt for indicators within your own organization's logs. An engineer would first use GTI to gather the full list of IoCs and behaviors, and then use UDM search to hunt for all of those indicators across their environment. Option B (Web Search) is unreliable for professional operations, and Option C (manual analysis) is too slow for a "common malware variant" and the need to act "quickly."

Question: 3

ITExamsQuiz

You scheduled a Google Security Operations (SecOps) report to export results to a BigQuery dataset in your Google Cloud project. The report executes successfully in Google SecOps, but no data appears in the dataset. You confirmed that the dataset exists. How should you address this export failure?

- A. Grant the Google SecOps service account the roles/iam.serviceAccountUser IAM role to itself.
- B. Set a retention period for the BigQuery export.
- C. Grant the user account that scheduled the report the roles/bigquery.dataEditor IAM role on the project.
- D. Grant the Google SecOps service account the roles/bigquery.dataEditor IAM role on the dataset.

✓ Answer: D

Explanation:

Comprehensive and Detailed 150 to 250 words of Explanation From Exact Extract Google Security Operations Engineer documents:

This is a standard Identity and Access Management (IAM) permission issue. When Google Security Operations (SecOps) exports data, it uses its own service account (often named service-`<project_number>@gcp-sa-bigquerydatatransfer.iam.gserviceaccount.com` or a similar SecOps specific principal) to perform the write operation. The user account that schedules the report (Option C) is only relevant for the scheduling action, not for the data transfer itself. For the export to succeed, the Google SecOps service account principal must have explicit permission to write data into the target BigQuery dataset.

The predefined IAM role `roles/bigquery.dataEditor` grants the necessary permissions to create, update, and delete tables and table data within a dataset. By granting this role to the Google SecOps service account on the specific dataset, you authorize the service to write the report results and populate the tables. Option A (`serviceAccountUser`) is incorrect as it's used for service account impersonation, not for granting data access. Option B (retention period) is a data lifecycle setting and has no impact on the ability to write new data. The most common cause for this exact scenario—a successful job run with no data appearing—is that the service account lacks the required `bigquery.dataEditor` permissions on the destination dataset.

(Reference: Google Cloud documentation, "Troubleshoot transfer configurations"; "Control access to resources with IAM"; "BigQuery predefined IAM roles")

Question: 4

ITExamsQuiz

You are a security engineer at a managed security service provider (MSSP) that is onboarding to Google Security Operations (SecOps). You need to ensure that cases for each customer are logically separated. How should you configure this logical separation?

- A. In Google SecOps SOAR settings, create a role for each customer.
- B. In Google SecOps Playbooks, create a playbook for each customer.
- C. In Google SecOps SOAR settings, create a permissions group for each customer.
- D. In Google SecOps SOAR settings, create a new environment for each customer.

✓ Answer: D

Explanation:

Comprehensive and Detailed 150 to 250 words of Explanation From Exact Extract Google Security Operations Engineer documents:

The correct mechanism for achieving logical data segregation for different customers in a Google Security Operations (SecOps) SOAR multi-tenant environment is by using Environments. The documentation explicitly states that "you can define different environments and environment groups to create logical data segregation." This separation applies to most platform modules, including cases, playbooks, and dashboards.

This feature is specifically designed for this use case: "This process is useful for businesses and Managed Security Service Providers (MSSPs) who need to segment their operations and networks. Each environment...can represent a separate customer." When an analyst is associated with a specific environment, they can only see the cases and data relevant to that customer, ensuring strict logical separation.

While permission groups (Option C) and roles (Option A) are used to control what a user can do within the platform (e.g., view cases, edit playbooks), they do not provide the primary data segregation. Environments are the top-level containers that separate one customer's data and cases from another's. Playbooks (Option B) are automation workflows and are not a mechanism for logical separation.

(Reference: Google Cloud documentation, "Control access to the platform using SOAR permissions"; "Support multiple instances [SOAR]")

Question: 5

ITExamsQuiz

Your organization has mission-critical production Compute Engine VMs that you monitor daily. While performing a UDM search in Google Security Operations (SecOps), you discover several outbound network connections from one of the production VMs to an unfamiliar external IP address occurring over the last 48 hours. You need to use Google SecOps to quickly gather more context and assess the reputation of the external IP address. What should you do?

- A. Search for the external IP address in the Alerts & IoCs page in Google SecOps.

- B. Perform a UDM search to identify the specific user account that was logged into the production VM when the connections occurred.
- C. Examine the Google SecOps Asset view details for the production VM.
- D. Create a new detection rule to alert on future traffic from the external IP address

✓ **Answer: A**

Explanation:

Comprehensive and Detailed 150 to 250 words of Explanation From Exact Extract Google Security Operations Engineer documents:

The most direct and efficient method to "quickly gather more context and assess the reputation" of an unknown IP address is to check it against the platform's integrated threat intelligence. The **Alerts & IoCs page**, specifically the **IoC Matches** tab, is the primary interface for this.

Google Security Operations continuously and automatically correlates all ingested UDM (Universal Data Model) events against its vast, integrated threat intelligence feeds, which include data from Google Threat Intelligence (GTI), Mandiant, and VirusTotal. If the unfamiliar external IP address is a known malicious Indicator of Compromise (IoC)—such as a command-and-control (C2) server, malware distribution point, or known scanner—it will have already generated an "IoC Match" finding.

By searching for the IP on this page, an analyst can immediately confirm if it is on a blacklist and gain critical context, such as its threat category, severity, and the specific intelligence source that flagged it. While Option B (finding the user) and Option C (viewing the asset) are valid subsequent steps for understanding the internal scope of the incident, they do not provide the **external reputation** of the IP. Option D is a **response** action taken only **after** the IP has been assessed as malicious. **(Reference: Google Cloud documentation, "View alerts and IoCs"; "How Google SecOps automatically matches IoCs"; "Investigate an IP address")**
